CRESA

TECNIDEA CIDUE
泰尼达 S.r.l.

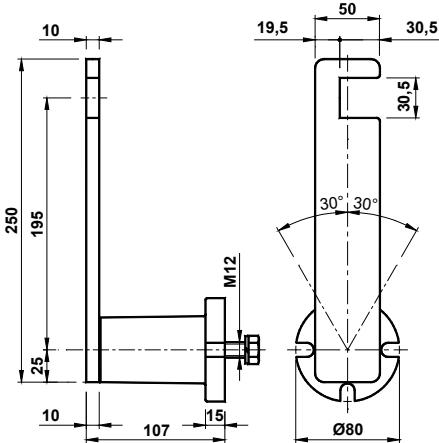

扭转式弹性组件, “张紧装置组件”: Tecnidea Cidue 的弹性组件是使用橡胶弹性的机械组件，在不同应用范围内使用，具有“弹簧”、“减震器”、“减速器”和“振动支撑”的功能。CRESA 组件结构简单，使用方便，具极高的弹性和对碰撞、敲击、振动和摆动的优良吸收功能。设计者可以这些产品取代陈旧的抗震、振动、减震和悬挂装置，避免昂贵的耽误时间，另外减低维修费用。不同的应用方式均使用同样的功能原理：位于由两个扭转角度为 45° 的方形部件的联接所构成的空间中的四个天然橡胶制圆柱的弹性变形性。橡胶圆柱使用天然橡胶，在其中加入专用添加剂并经过特殊的化学处理和热处理使其适合这些应用。两个方形部件的可允许的最大扭转角度为±30°，此角度与振动频率成反比。由于预应力橡胶的摩擦防止向两个方向中其中一个方向移出，两个方形部件无需使用轴式约束系统。为此，其特殊的构造方式组成一项完整的弹性系统，以最小的占地提供极大的可信度，永远消除噪音（由于在它们之间没有金属部分的接触）和污染（由于不使用润滑剂并且磨损极低）的问题，同时显著减低运转过程的费用。

CRESA 产品是扭转式运转的弹性组件。这些产品是扭转弹簧，可应用于众多的方面，最广泛的应用方面为：链条和皮带张紧装置、输送带刮料器弹性支撑、压力组件和缓动装置。使用天然橡胶的扭转弹簧具有对震动极高的吸收力，由于在受到外界的刺激，比如说振荡，可通过在橡胶分子在移动中产生的摩擦而吸收动能，将其转变成热量而排放到外界。CRESA 组件用于链条传输或皮带传输，不仅长期保持活动部件的拉紧而且可以削减在运动机制中所产生的振动，保证更常规的效能并延长机器其他部件的寿命。在本产品目录中所展示的所有弹性组件在-40°C 至+80°C 的环境温度使用。由于所使用的材料本性和处理方式，以及其抗污垢性、抗水性和抗日光性，这些产品组件均可在极端的外界环境中使用。Tecnidea Cidue 拥有世界上最广泛的张紧装置系列因此可为各种应用提供理想的解决方式。与腐蚀剂接触的应用中，我们向您推荐我们的 NIC 产品，这些产品表面经过镀锌处理。如客户要求，我们可提供经过表面镀锌处理的弹性组件。为了在室外、与潮湿剂接触或在食品或医药领域的应用，我们推荐您使用完全用塑性材料制造的 CIAO 产品。为了在直至 300°C 的条件下或低空间的条件下使用，推荐使用 ARCO 系列产品。

ELASTIC ROTATING ELEMENTS, “TIGHTENERS ELEMENTS”: The elastic elements produced by TECNIDEA CIDUE S.r.l. are mechanical parts which exploit the elastic characteristics of rubber for use in various applications such as: springs, shock absorbers, decelerators and oscillating supports. CRESA components, with their simple structure and use, are distinguished for their high elasticity and ability to absorb impacts, blows, vibrations and oscillations. With these products, designers can replace obsolete vibration-damping, oscillating, shock absorbing and suspension systems, avoiding expensive wastes of time and also reducing maintenance costs. The various applications all exploit the same operating principle: the elastic deformation of four cylinders made of natural rubber, lodged inside the cavities that result when two elements with square section are turned at an angle of 45° one to the other. The rubber cylinders have a base of natural rubber, suited for use in these applications by inserting particular additives and carrying out special chemical and heat treatments. The maximum admissible angle of torsion between the two square sections is ±30° and is inversely proportional to the oscillation frequency. It is not necessary to use axial containment systems for the two square-section elements, since the friction of the prestressed rubber prevents them coming out in either of the two directions. The particular constructive system therefore forms a highly reliable, integral elastic system with minimum bulk, which permanently eliminates problems such as noise (there are no metal parts in contact with one another) and pollution (there are no lubricants and wear is insignificant), with a notable reduction of running costs.

CRESA articles are elastic elements that work by rotation. These products are torsion springs which may be used for a great many applications, the most common of which are: chain or belt tighteners, elastic supports for belt scrapers, pressure elements, decelerators. The natural rubber used as a torsion spring has a high capacity of absorbing oscillations because, when it is stressed by external sources, such as vibrations, it absorbs the kinetic energy by means of the friction which is formed between the moving rubber molecules and transforms it into heat which is dispersed in the environment. CRESA elements are used in chain or belt transmissions, not only to keep the flexible element taut over time, but also to absorb the vibrations that are created in the kinematic mechanisms, ensuring a more regular operation and thus increasing the working life even of other components of the machine. All the elastic elements in this catalogue can work in a temperature range varying from -40°C to +80°C and under any external environmental condition since, thanks to the nature of the materials used and the treatments to which they are subjected, they are insensitive to dirt and are very resistant to water and to the rays of the sun. Tecnidea can boast the widest range of tighteners in the world, so the ideal solution can be supplied for every application. For applications in contact with corrosive agents we recommend our NIC products, on which the surface is covered with a nickel-plating treatment. On request we can supply elastic elements covered with a galvanising treatment. For outdoor applications, in contact with humid agents, or in the food or pharmaceutical sectors, we recommend our CIAO products made entirely of plastic. For applications with temperatures up to 300°C or with small bulk, we recommend our ARCO products.

刮料器用弹性组件 / ELASTIC ELEMENTS FOR SCRAPERS

RER 40 DX (编号 N° RE010850)

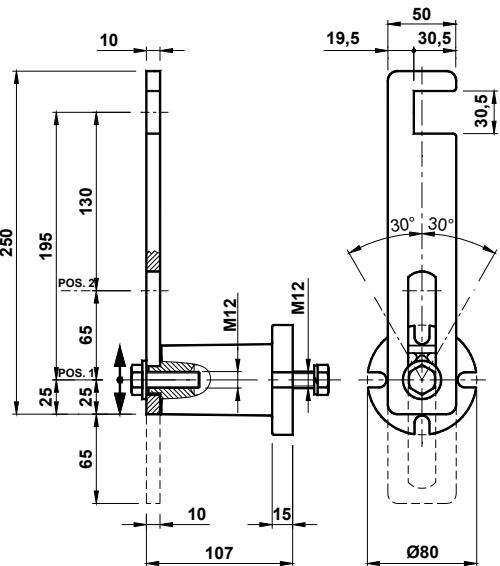

RER 40 具焊接在轴上的手柄。

REMER 40 具带槽手柄，可允许对轴进行调整，因此可调节清洁器的力量。扭转角度 $\pm 30^\circ$ 。工作温度从 -40°C 到 $+80^\circ\text{C}$ 。

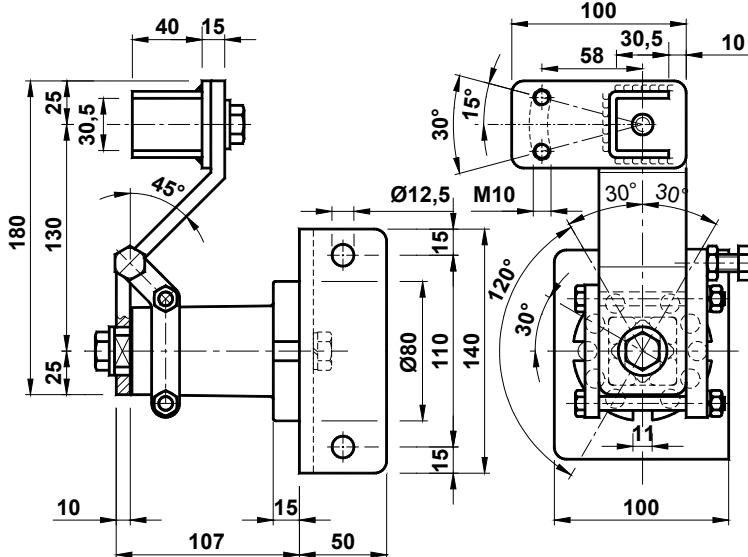

根据不同需要和数量的要求，可提供不同尺寸和形状的这类产品。

RER 40 has the lever welded to the pin.

REMER 40 has the lever with a slot which allows axial regulation and therefore an adjustable force of the cleaning device. Rotation angle $\pm 30^\circ$. Operating temperature from -40°C to $+80^\circ\text{C}$. On request, these products are also supplied with different dimensions and shapes, according to necessities and quantities.

REMER 40 (编号 N° RE010860)

RERU 40 (编号 N° RE010870)

这个弹性组件允许对清洁刮料器倾角进行调整（总共 30° ），并可调整底座组件的安装角度（已定为总共 120° / 之间有成 30° 的 5 个位置）。

具轴调整的弹性组件 RERU 40 已配有 PR 40 预加载荷系统，此系统可应用于简化安装操作并将手柄在事先确定的高度固定。

扭转角度 $\pm 30^\circ$ 。

工作温度从 -40°C 到 $+80^\circ\text{C}$ 。

根据不同需要和数量的要求，可提供不同尺寸和形状的这类产品。

This elastic element allows both regulation of the angle of incidence of the cleaning scraper (total 30°) and of the fitting angle of the base element (already equipped for total 120° / 5 positions with angles of 30° one from the other). The elastic element RERU 40 with radial regulation is already equipped with a PR 40 preloading system which may be used both to facilitate assembly operations and to block the lever at a predetermined height.

Rotation angle $\pm 30^\circ$.

Operating temperature from -40°C to $+80^\circ\text{C}$.

On request, these products are also supplied with different dimensions and shapes, according to necessities and quantities.

技术: 图表 / TECHNOLOGY: GRAPHICS

◆ **减震系数**

由于取决于温度或加速等因素，减震等级不是定值。在负荷曲线和松放曲线之间的面积代表因振动而释放的能量。

◆ **SHOCK ABSORBING FACTOR**

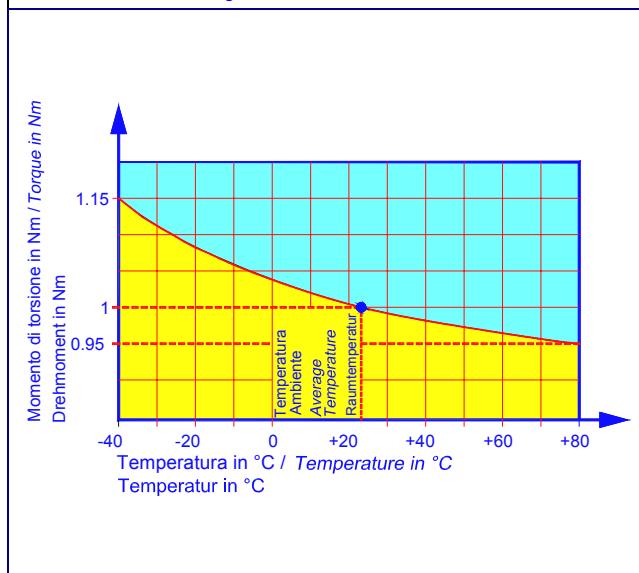

The shock absorption value is not constant as it depends on factors such as temperature and acceleration. The area between the loading curve and the release curve represents the loss of energy by oscillation.

◆ **弹性特征**

振动组件的特殊设计使得在负荷和松放阶段具有渐进的弹力（由左图所示）。扭矩与橡胶的长度成比例。

◆ **ELASTICITY**

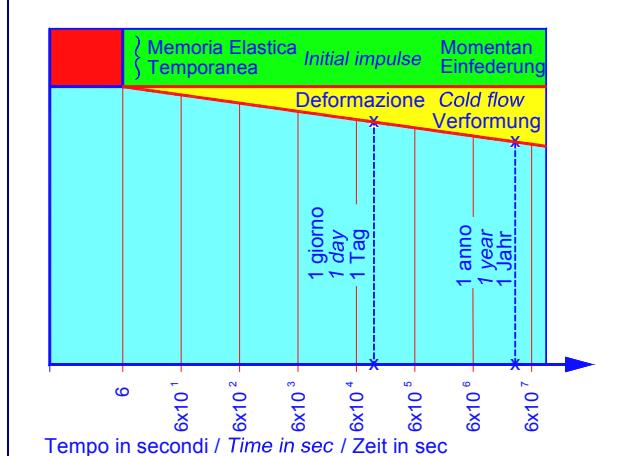

The special construction of the oscillating element offers progressive elasticity (as can be seen in the graph at the side) both in the loading and releasing phase. The torque is proportional to the length of the rubber.

◆ **工作温度**

用于我们产品的橡胶是为预定在-40°C 至+80°C 之间波动的温度范围内的应用而生产的。如果超过 80°C，丧失机械耐性，其结果是减震比例在低温条件下升高，在其他温度减低。另外，应考虑到实际工作温度不是外围环境的温度，因为橡胶和金属材料之间的摩擦可造成进一步的温度升高。

◆ **OPERATING TEMPERATURE**

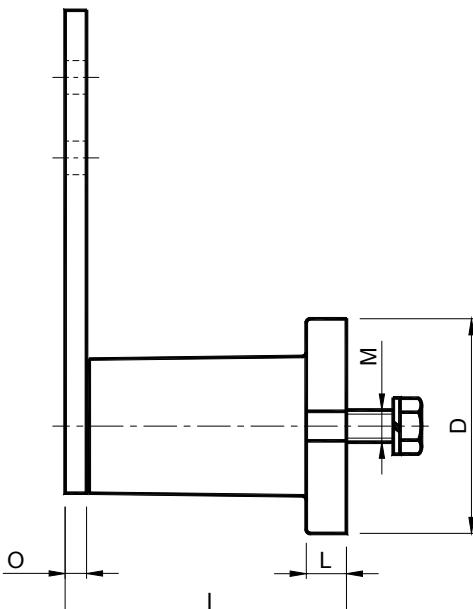

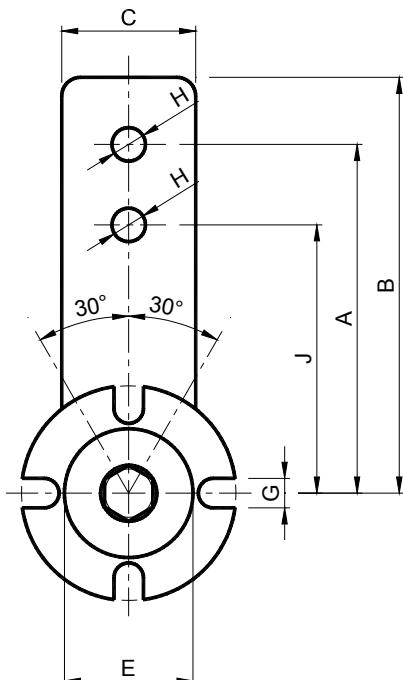

The rubber used in our products has been designed to operate in a -40°C +80°C temperature range if the temperature exceeds 80°C, mechanical resistance is reduced and the percentage shock absorption consequently increases at low temperatures and drops at high temperatures. It should also be remembered that the real operating temperature is not the temperature of the surrounding environment as the friction produced between the rubber and the metal causes a further rise in temperature.

◆ **橡胶的长期变形**

左图表表示 VIB 产品中所使用的橡胶在长期使用过程中的变形。操作范围为 ±30° 扭转角度，变形负荷在专门的列表中显示。由此图可见在一天中的变形比一整年工作变形的一半稍多。与静止位置相比，用于我们产品中的橡胶的不回返角度在 3° 至 5° 范围内。

◆ **LONG-TERM DEFORMATION OF THE RUBBER**

The graph at the side shows the long-term deformation of the rubber used in the CRESA elements. The operating range varies by ±30° rotation and deforming load is as shown in the specific technical tables. As can be seen one day's deformation of an entire year of operation. The non-return memory of the rubber used in our products ranges 3° to 5° with respect to the rest position.

预加负荷用螺钉的基本弹性组件 - 型号: CEB e CEBP (*) /

Basic elastic elements – Type: CEB and CEBP with screw for preloading ()*

CEB

CEBP

CEB 和 CEBP 是基本弹性支撑，与在产品目录中显示的可互换的附件一并使用，或者根据需要与其他另外设计的特别部件组合。为了便利安装、拆除和调整的操作，CEBP 配有预加负荷系统(*)。

扭转角度 ± 30°。

工作温度从 -40°C 至 +80°C。

CEB and CEBP are basic elastic supports either to utilize with the interchangeable accessories represented in the catalogue, or to assemble themselves with special particulars that have to be realized separately on the different requests.

CEBP are equipped with preloading system (*) in order to facilitate the mounting, dismantling and regulation operations.

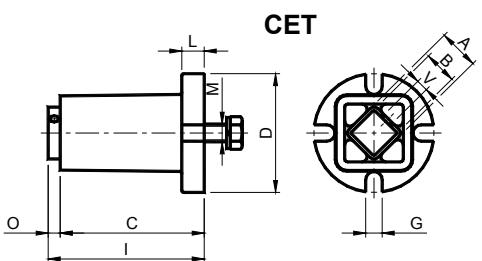

Rotation angle ± 30°

Operating temperature from -40°C to +80°C.

计算手册 / CALCULATION MANUAL

链条或皮带传输

(用于传输或输送的)滚轮链和皮带是称为包络灵活组件的机械结构系列的一部分，这些结构具仅对拉伸应力做出反应的特性。这些机械结构一般应用于在两个旋转轮轴之间传输能量，但也可用于物品运输或抬举。为了正确使用包络灵活组件，有必要在设计阶段，提供一项始终在运转过程中使其处于张紧状态的系统。自动旋转式张紧装置具有一个旋转点，称为支点，在其上张紧装置臂用力，由此拉紧链条或皮带。

CHAIN OR BELT TRANSMISSIONS

 Roller chains (for transmission or transport) and belts are part of the series of mechanical systems called enveloping flexible elements which share the characteristic of reacting only to tensile stress. These mechanical parts are generally used to transmit power between two rotating hubs, but they may also be used to carry or lift objects. For a correct use of enveloping flexible elements it is necessary, in the design phase, to contemplate a system for keeping these units always taut during operation. Automatic rotation tighteners present a point of rotation, known as the fulcrum, on which the arm of the tightener acts, thus tightening the chain or belt.

滚轮链条 DIN 8187

在运转过程中，链条的接触表面的磨损（轴、轴衬和滚轮）造成更严重的齿隙游移和链条增长，如果过度，可造成：缠绕角度更小，缺乏传输比例的恒定性，链条滚轮和轮齿的接触不正常，磨损提早，高噪音，振动，滑齿，链条从传输带上滑落，在更严重的情况下，链条的断裂。

因此有必要为传输设备配备可弥补链条增长情况并不断消减振动的自动链条张紧装置。旋转式链条自动张紧装置应安置在传动系统的缓慢端尽量与驱动齿轮接近的位置。可安装在传动系统外部（图 2）和内部（图 3），可能的外部安装为更佳选择。旋转式自动链条张紧装置具有一个旋转点，称为支点。在支点上，张紧装置的臂通过拉紧链条或皮带而作用。安装张紧装置时，支点不处于链条受力直线方向极为重要（图 5），这样的话不会被卡住。

ROLLER CHAINS DIN 8187

 The wear of the surfaces of a chain (pins, bushes and rollers) in contact with each other during operation creates a greater play and the relative stretching of the chain; when this is excessive it may cause a smaller winding angle, lack of constancy in the transmission ratio, abnormal contact between the chain rollers and the teeth of the pinion, premature wear, high noise, vibrations, tooth skipping, escape of the chain from the transmission and, in extreme cases, breakage of the chain.

It is therefore inevitable to equip the transmission with an automatic chain tightener, which allows the recovery of stretching and constantly absorbs vibrations. Automatic rotation chain tighteners must be positioned on the loose part of the transmission, as close as possible to the motor pinion. They may be fitted either on the outside of the transmission (Fig 2) or on the inside (Fig 3), preferably the former, if possible. Automatic rotation tighteners present a point of rotation, known as the fulcrum, on which the arm of the tightener acts, thus tightening the chain or belt. It is extremely important to position the tightener in such a way that its fulcrum is never in the direction of the line of application of the chain force (Fig 5), so that it can never get stuck.

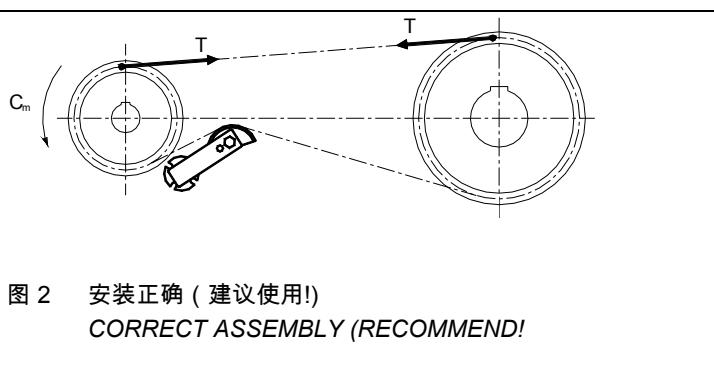

图 2 安装正确 (建议使用!)
CORRECT ASSEMBLY (RECOMMEND!)

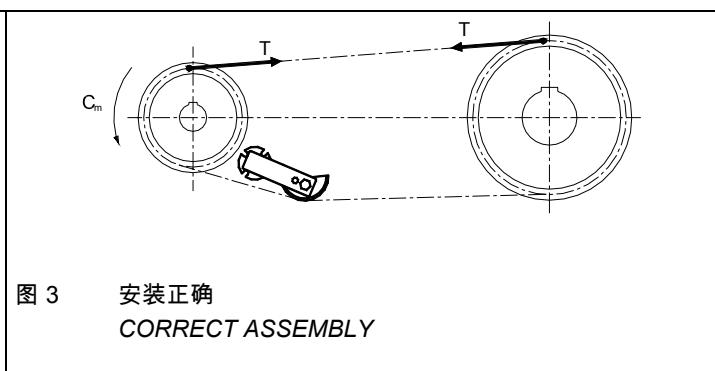

图 3 安装正确
CORRECT ASSEMBLY

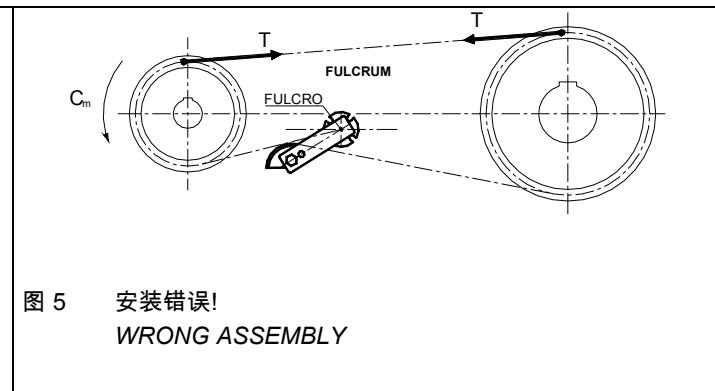

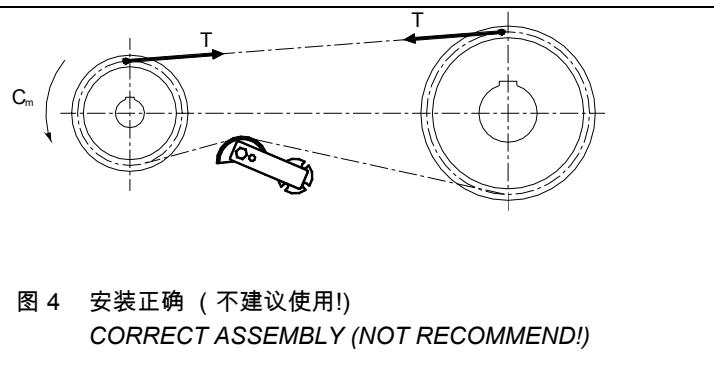

图 5 安装错误!
WRONG ASSEMBLY

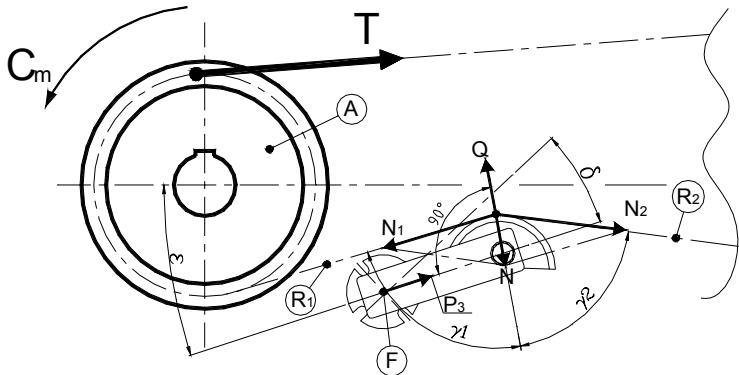

图 6

A =	驱动齿轮 <i>driving toothed</i>
T =	张紧臂所受张力 <i>tension on the tensed branch</i>
C_m =	驱动扭矩 <i>motor torque</i>
R_1 =	进入张紧装置的链端 <i>section of chain entering the tightener</i>
R_2 =	离开张紧装置的链端 <i>section of chain leaving the tightener</i>
F =	支点或旋转点 <i>fulcrum or point of rotation</i>
Q =	由张紧装置释放的力量 <i>force released by the tightene</i>
N =	链反应力量 <i>chain reaction force</i>
N_1 =	在 R_1 端上的 N 分力 <i>component of N on section R_1</i>
N_2 =	在 R_2 端上的 N 分力 <i>component of N on section R_2</i>
P_3 =	弹簧轴压缩力 <i>spring axial compression force</i>
δ =	张紧装置工作角度 <i>tightener work angle</i>
ϵ =	张紧装置安置角度 <i>tightener positioning angle</i>
$\gamma_{1/2}$ =	张紧装置链条进出角度 <i>chain angle of entering and leaving the tightener</i>

张紧装置释放一份与旋转臂垂直的力量 Q (图 6)，由于机械效应，这份能量与分配在张紧装置进入端 R_1 和离开端 R_2 上所受的牵引力 N_1 和 N_2 总共的力量 N 平衡。在安置链条张紧装置时，应注意两份力量 Q 和 N 尽可能在同一准线上，如此不会发生在支点上施加切线力。即使在一定限度内，这些不想要的切线力可由橡胶轴压缩力 P_3 抵消。因此，张紧装置的安置取决于 δ 角，即弹性组件的工作角度，及 ϵ ，即相对于传动系统的放置角度，如此 γ_1 角和 γ_2 角尽可能相等。

 A tightener releases a force Q (Fig. 6) perpendicular to the rotation arm which by reaction is balanced by the chain with the force N which is distributed with the traction forces N_1 and N_2 on the sections entering and leaving the chain tightener, respectively R_1 and R_2 . When positioning a chain tightener, you must ensure that the forces Q and N are as much as possible on the same line so that there is no formation of tangential components which would be discharged on the fulcrum. Even though, within certain limits, these undesired tangential forces are cancelled by the axial compression force P_3 of the rubber. The positioning of the tightener therefore depends on the angle δ , that is the working angle of the elastic element, and on the angle ϵ , that is the positioning angle with respect to the transmission, so that the angles γ_1 and γ_2 are equal as much as possible.

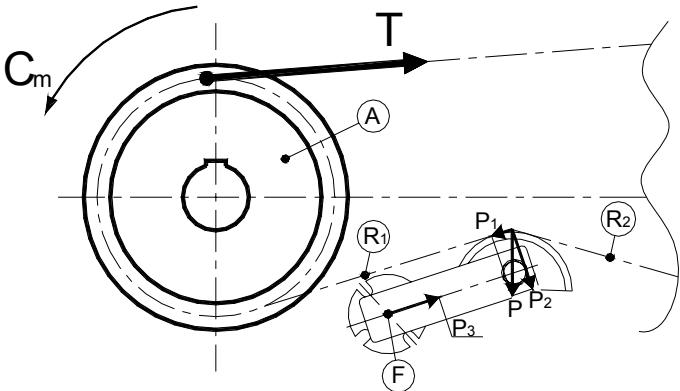

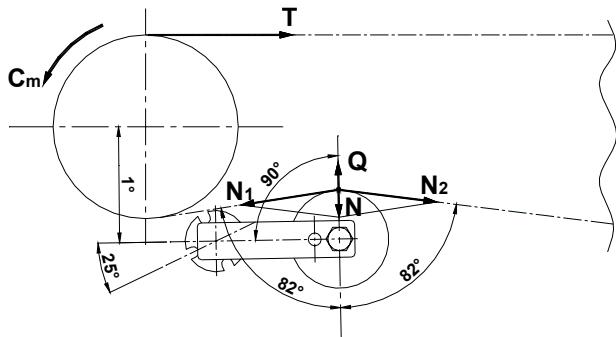

图 7

A =	驱动齿轮 driving toothed wheel
T =	张紧臂张力 pull on chain on the tensed branch
C_m =	驱动转矩 motor torque
R_1 =	进入张紧装置的链端 section of chain entering the tightener
R_2 =	离开张紧装置的链端 section of chain leaving the tightener
F =	支点或旋转点 fulcrum or rotation point
P =	重量力 weight force
P_1 =	P 正切分力 tangential component of P
P_2 =	P 普通分力 normal component of P
P_3 =	弹簧轴压缩力 spring axial compression force

图 7 显示在水平传动系统中链条的重力 P 对张紧装置的影响。事实上，链条的重量在张紧装置上分为在手柄上普通的力量 P_2 和力量 P_1 。后一份压缩力量由弹簧轴压缩力 P_3 所平衡。

Fig. 7 shows the influence of the weight force P of the chain on the tightener in horizontal transmissions. In fact, the weight of the chain is divided on the chain tightener into a force P_2 normal to the lever and a force P_1 . The latter compression component is balanced by the spring axial compression force P_3 .

滚轮链条计算实例: / Example of calculation for roller chains:

C_m =	驱动转矩 以 Nm 表示 motor torque in Nm
M_t =	在正常条件下要传输的转矩 以 Nm 表示 torque to be transmitted at uniform rating in Nm
T =	张紧臂所受张力 pull on chain on the tensed branch
W =	电动机功率 power drive
n =	驱动齿轮每分钟转数 rounds per minute of the driving toothed wheel
Q =	由张紧装置释放的力量 force released by the tightener
N =	链反应力量 chain reaction force
N_1 =	N 的分力 component of N
N_2 =	N 的分力 component of N

图 8

电动机性能: $W=15 \text{ KW}$; $n=1460$ 转 / 分

将之前的数据转换为国际计量单位: $\omega=1460x\pi/30=152.81 \text{ rad/s}$

$W=M_t \times \omega \rightarrow M_t=P/\omega=98.2 \text{ Nm}$ 为计算方便假设 $M_t=100 \text{ Nm}$ 。

假设电动机的工作系数 f_s 为 3.5 $\rightarrow C_m=3.5 \times M_t=350 \text{ Nm}$

驱动滑轮径节 $D_p=150 \text{ mm} \rightarrow r=0.075 \text{ m}$

$T \times 0.075=350 \rightarrow T=4667 \text{ N}$

假设在链条上的安全系数为 10。

因此链条应具有至少 46670 N 的最大应力 \rightarrow 我们选择一个简单链条，齿矩为 $p=1'' \times 17.02 \text{ mm}$ 轴距 $l=2m \rightarrow$ 松弛端重量 = 54 N 在配套元件选择表上，我们选择一份配套元件，比如 RO 40-5 S，应选择尺寸为 40 的弹性组件。张紧装置应尽可能按图 8 的描述安装。

 Motor features: $W=15 \text{ KW}$; $n=1460 \text{ rpm}$

We convert the previous values into the unit of measures SI: $= 1460 \times \pi / 30 = 152,81 \text{ rad/s}$

$W=M_t \times \omega \rightarrow M_t=P/\omega=98,2 \text{ Nm}$ we presume $M_t=100 \text{ Nm}$ to facilitate calculations.

It is supposed that the motor has a service factor f_s of 3,5 $\rightarrow C_m=3,5 \times M_t=350 \text{ Nm}$

Diametral pitch of the driving pulley $D_p=100 \text{ mm} \rightarrow r=0,075 \text{ m}$

$T \times 0,075=350 \rightarrow T=4667 \text{ N}$

Let us suppose a safety factor of 10 on the chain.

The chain must therefore have a yield stress of at least 46670 N \rightarrow Let us choose a simple chain with pitch $p=1'' \times 17,02 \text{ mm}$ Centre distance $l=2m \rightarrow$ Free section weight = 54 N

From the kit selection table we take, for example, a RO 40-5 S kit on which we must apply a 尺寸 40 elastic element. The tightener must be positioned as much as possible as described in Fig 8.

平面、梯形和圆形皮带

一般来讲，皮带以塑性材料制造，可以具长方形（平带）、梯形（V型带）或圆形（履带）切面。有关嵌齿轮皮带，参考有关滚轮链条的章节。应观察皮带的两项主要参数为：皮带的宽度和其速度。皮带的宽度或皮带面的宽度应比滚轮的宽度大约低 10mm。在皮带施与滚轮的旋转速度提高，由摩擦所致的温度升高时，应选择钢制和塑料的滚轮，由此可保证轴承在其套中的耦合。

FLAT, TRAPEZOIDAL OR CIRCULAR BELTS

 Belts are generally made of plastic material and may have a rectangular section (flat belts), a trapezoid section ("V" belts) or a circular section (side belts). For cogged belts consult the section on roller chains. For belts, two main parameters must be observed: the width of the belt and its speed. The width of the belt or of the bundle of belts must be about 10 mm smaller than that of the roller and when the rotation speed that the belt exerts on the roller is high and the temperatures due to friction increase, steel rollers should be preferred to plastic ones because they ensure a better coupling of the bearings inside their housings.

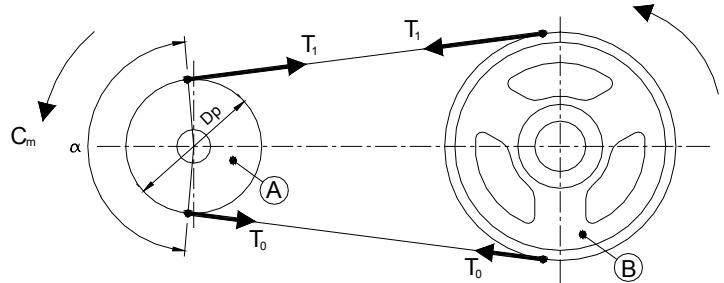

图 9

A=	驱动滑轮 driving pulley
B=	从动滑轮 driver pulley
D_p =	驱动滑轮径节 以 mm 表示 diametral pitch of the driving pulley in mm
T_1 =	张紧臂所受张力 以 N 表示 tension on the tensed branch in N
T_0 =	从动臂所受张力 以 Nm 表示 tension on the driver branch in N
C_m =	主动轴上的最高转矩 以 Nm 表示 maximum torque on the driving shaft in Nm
α =	缠绕角度 angle of twist

由于皮带长度伸展的错误以及在皮带和滑轮之间存在的打滑，皮带传输不能保证完美持久的传动比。这些滑动由以下因素造成：缠绕角度 α 小，由于接触表面有油、脂肪存在的情况造成摩擦系数低，由磨损和老化所造成的皮带的屈服以及皮带预紧力低。

为了消除打滑现象，有必要使用自动张紧装置，由此可保证对皮带加长做出修正并在皮带轨道的适当部位造成一个结“n”而削减振动；如果皮带张紧装置使用从外部向内部驱动的方式安置，可提高缠绕角度 α 。我们建议将皮带张紧装置安装在传动装置外部，图 10，但也可安装于内部，图 11。钢制或塑料滚轮仅适用与皮带背部的接触。在使用 V 型皮带和齿形皮带进行从内部到外部的张紧时，所使用的滑轮的凹槽应具有皮带轮廓。

 The belt transmission does not ensure a perfect constancy of the transmission ratio due to inevitable errors in the development of the length of the belt and because of the presence of slipping between belt and pulley due to the following factors: small winding angle α , low friction coefficient between the contact surfaces due to the possible presence of oil or grease, yielding of the belt caused by wear and age and low pre-tightening of the belt.
 To avoid micro-sliding, the use of an automatic tightener becomes a must and a way to recover any lengthening as well as vibrations with an “n” knot in a convenient position along the belt path if the belt tightener is positioned with operation from the outside towards the inside. We advise fitting the belt tightener on the outside of the transmission, Fig. 10, but it may also be positioned on the inside, Fig. 11. Steel or plastic rollers are suitable only for coming in contact with the back of the belt. Instead, when tightening is performed from the inside towards the outside, with V-belts and cogged belts, a pulley which reproduces the outline of the belt must be used.

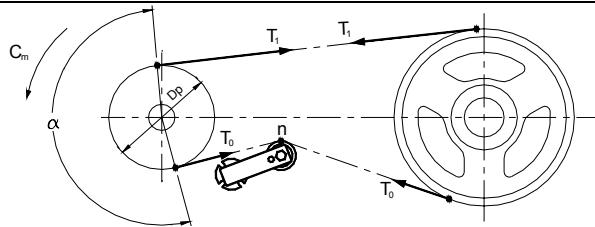

图 10 从外部向内部的张紧
TIGHTENING FROM THE OUTSIDE TOWARDS THE INSIDE

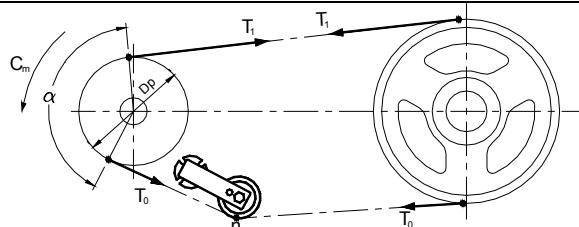

图 11 从内部向外的张紧 TIGHTENING FROM THE INSIDE TOWARDS THE OUTSIDE

在选择张紧装置时，应了解沿着皮带作用的拉力，由以下数据获得：驱动滑轮旋转平衡方程式 1 和打滑极限条件方程式 2。一般来讲 α 应接近 π rad。要解决的系统如下：

 You can make the perfect selection of the tightener if you know which are the pulling tensions acting along the belt, which are given by: which are given by: equation 1 rotation balance of the drive pulley and equation 2 slipping limit condition. In general α must be approximately π rad. The system to be solved is the following:

$$\left\{ \begin{array}{l} (T_1 - T_0) \cdot \frac{D_p}{2} \cdot \frac{1}{1000} = C_m \text{ (方程式 1)} \\ T_1 = T_0 e^{\eta \alpha} \quad \text{(方程式 2)} \end{array} \right.$$

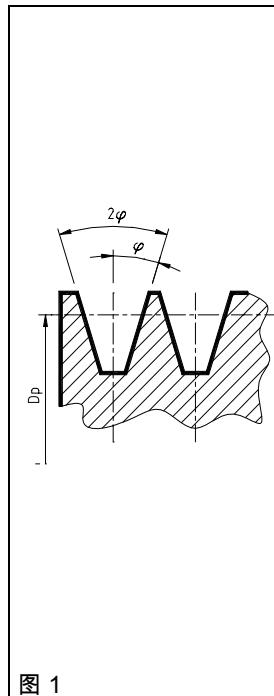

图 1

e = 自然常数 e , 约为 2.72

Nepero's number equal to 2,72

□ = 在皮带和滑轮之间的摩擦系数 (在 V 型皮带的情况下，应将此系数除以 $\sin(\varphi)$ ，在此 φ 为沟槽的半开角，以 rad 表示)

friction coefficient between belt and pulley (in case of V-type belts, this coefficient has to be divided by $\sin(\varphi)$, where φ is the angle of the semiaperture of the rim of the pulley in rad)

M_t = 在正常条件下所要传输的转矩 以 Nm 表示

torque to be transmitted at uniform rating in Nm

C_m = 主动轴上最大转矩 以 Nm 表示

maximum torque on the driving shaft in Nm

f_s = 工作系数 (2-5)

duty factor (2-5)

 “C_m” 是在启动过程中所达到的最高转矩，即在最严重的打滑情况下，以工作系数“f_s” (2-5)乘以在正常条件下所要传输的转矩“M_t”，即 $C_m = f_s \cdot M_t$.

自动张紧装置应安置于从动端，与驱动滑轮最接近的部位。张紧装置的弹性组件应产生一份力量，这份力量有必要至少对在安装张紧装置的链条端所受的两份张力之和作出平衡。

“ C_m ” is the maximum value of the couple that can be reached during the start up, i.e. in the heaviest sliding conditions. This is obtained by multiplying the value of the couple to be driven “ M_t ” by a service factor “ f_s ” (2÷5) in regimen conditions, i.e. $C_m = f_s \cdot M_t$.

The automatic tightener should be positioned in the driven branch as close as possible to the driving pulley. The tension in the belt branch on which the tightener acts is steady because the friction and contrasting forces on the belt tightener are almost zeroed. The force developed by the elastic element should be at least necessary to re-balance the resulting value from the sum of the two components of the tension on the branch on which the tightener is applied, along the tightener axis itself.

V-带计算实例: / Example of calculation for V-belts:

	A= 驱动滑轮 <i>driving pulley</i> B= 从动滑轮 <i>driver pulley</i> C_m = 驱动转矩 以 Nm 表示 <i>motor torque in Nm</i> M_t = 在正常条件下所要传输的转矩 以 Nm 表示 <i>torque to be transmitted at uniform rating in Nm</i> T_1 = 在张紧臂上的张力 以 N 表示 <i>tension on the tensed branch in N</i> T_0 = 在从动臂上的张力 以 N 表示 <i>tension on the driver branch in N</i> W= 电动机功率 <i>power drive</i> n= 驱动齿轮每分钟转数 <i>rounds per minute of the driving toothed wheel</i>
---	---

图 13

<p>电动机性能: $W=3 \text{ Cv}$ $n=940$ 转/分 将之前的数据转换为国际计量单位: $W=3 \times 735=2205 \text{ W}$ $\omega=940 \times \pi / 30=98.4 \text{ rad/s}$ $W=M_t \times \omega \rightarrow M_t=W/\omega=22.4 \text{ Nm}$ 假设 $f_s=2.5$ $C_m=2.5 \times M_t=56 \text{ Nm}$ 驱动滑轮径节 $D_p=100 \text{ mm} \rightarrow D_p=0.05 \text{ m}$ $\left\{ \begin{array}{l} (T_1-T_0) \times 0.05=56 \rightarrow (T_1-T_0)=1120 \\ T_1=T_0 e^{\eta \alpha} \end{array} \right. \quad \text{(方程式 1)}$ $\left. \begin{array}{l} T_1=T_0 e^{\eta \alpha} \\ T_1=T_0 \times e^{0.69 \times 3.44}=T_0 \times 10.74 \end{array} \right. \quad \text{(方程式 2)}$ </p>	<ul style="list-style-type: none"> ○ 缠绕角度 $\alpha=197^\circ \times \pi / 180^\circ=3.44 \text{ rad}$ ○ 皮带和滑轮之间的摩擦系数 $\eta=0.2$ ○ V型皮带半开角 $\varphi=17^\circ \rightarrow \sin(\varphi)=0.29$ ○ V带 $\rightarrow \eta'=0.2 / \sin(\varphi)=0.2 / 0.29=0.69$ ○ 常数 $e=2.72$ $\left\{ \begin{array}{l} T_1=T_0 e^{0.69 \times 3.44}=T_0 \times 10.74 \quad (\text{方程式 2}) \\ (10.74 T_0 - T_0) = 1120 \quad (\text{方程式 1}) \end{array} \right.$ $\rightarrow T_0=115 \text{ N}$ $\rightarrow T_1=1120+115=1235 \text{ N}$ $\rightarrow F=2 \times 115 \times \cos(64.5^\circ)=99 \text{ N}$ <p>现在可选择一台可产生比力量 F 更高的推力的旋转式张紧装置。</p>
---	---

 Motor features: $W=3 \text{ Cv}$

$n=940 \text{ rpm}$

We convert the previous values into the unit of measure SI:

$$W=3x735=2205 \text{ W}$$

$$\omega = 940x\pi/30=98,4 \text{ rad/s}$$

$$W=M_t \times \omega \rightarrow M_t=W/\omega=22,4 \text{ Nm}$$

We suppose $f_s=2,5$

$$C_m=2,5 \times M_t=56 \text{ Nm}$$

Diametral pitch of the driving pulley

$$D_p=100 \text{ mm} \rightarrow D_p=0,05 \text{ m}$$

$$\begin{cases} (T_1-T_0) \times 0,05=56 \rightarrow (T_1-T_0)=1120 & (\text{equation 1}) \\ T_1=T_0 e^{\eta \alpha} & (\text{equation 2}) \end{cases}$$

- angle of twist $\alpha=197^\circ \times \pi/180^\circ=3,44 \text{ rad}$
- friction coefficient between belt and pulley $\square=0,2$
- V-type belt with angle of semiaperture $\varphi=17^\circ \rightarrow \sin(\varphi)=0,29$
- V-type belt $\rightarrow \square'=0,2/\sin(\varphi)=0,2/0,29=0,69$
- Nepero's number $e=2,72$

$$\begin{cases} T_1=T_0 e^{0,69 \times 3,44}=T_0 \times 10,74 & (\text{equation 2}) \\ (10,74 T_0 - T_0) = 1120 & (\text{equation 1}) \end{cases}$$

$$\rightarrow T_0=115 \text{ N}$$

$$\rightarrow T_1=1120+115=1235 \text{ N}$$

$$\rightarrow F=2 \times 115 \times \cos(64,5^\circ)=99 \text{ N}$$

Now the rotation tightener can be chosen, which must develop a thrust greater than the force F.

聚乙烯滑块 – 型号: OVR

Polyethylene sliding block – Type: OVR

高分子密度聚乙烯滑块。工作速度 ≤ 20 米 / 分。滑块工作温度 ≤ 70°C。OVR 滑块的特殊椭圆形状允许在双边使用。

Polyethylene sliding block high molecular density. Operating speed ≤ 20 m/min. Sliding block operating temperature ≤ 70°C. The special oval form of the sliding block OVR allows to use it on both sides.

链条张紧装置配套元件 / KIT for chain tighteners

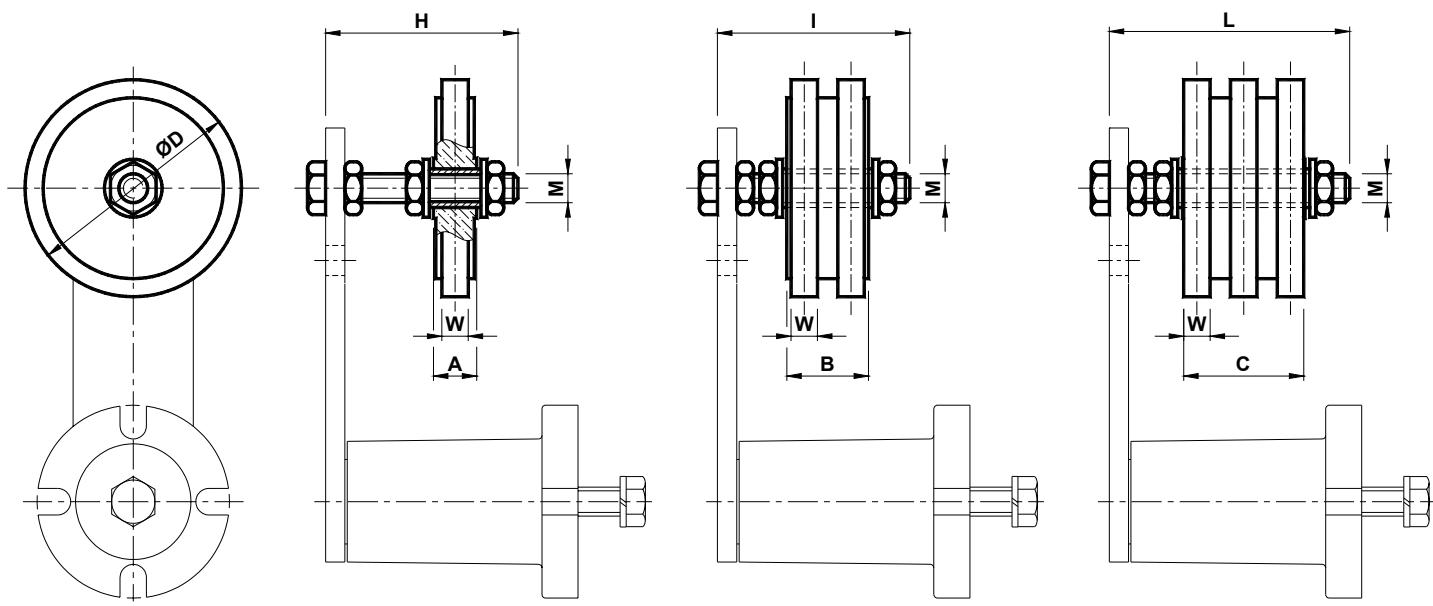

聚乙烯轮 – 型号: RO
Polyethylene wheel set – Type: RO

此配套元件由一个在轴上的空转轮组成。轮材质为具高分子密度的聚乙烯。工作速度 ≤ 30 米 / 分。轮工作温度 ≤ 70°C。

 *KIT is composed by a idle wheel on a pin. Polyethylene wheel, high molecular density. Operating speed ≤ 30 m/min. Wheel operating temperature ≤ 70°C.*

张紧装置组件- 型号: REG / Tighteners elements – Type: REG

NIC 为 CRESA 弹性张紧装置。在安装前其金属表面得到镀镍处理。这项特征使其对恶劣的工作条件比如与腐蚀剂的接触情况下具有极高的耐性。

NIC are CRESA tighteners elements which are subjected to nickel-plating of the metal surfaces before assembly. This characteristic makes them highly resistant to severe working conditions such as those in contact with corrosive agents.

扭转角度 $\pm 30^\circ$

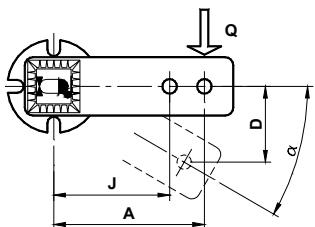

工作温度从 -40°C 至 $+80^\circ\text{C}$

Rotation angle $\pm 30^\circ$

Operating temperature from -40°C to $+80^\circ\text{C}$

CRESA 组件可在机器金属结构上直接装配，否则可使用上图所示的夹具 SB。

The elements CRESA can be mounted directly on the metallic structure of the machine otherwise you can use the supports SB as indicated in the above figure.

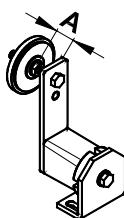

附在弹性组件上的标签 S, 帮助识别预加负荷角度。凹处 N 用于主体的固定，使得组件的固定更可靠。

The label S, which is put on the elastic elements, helps the identification the preloading angle. The niche N is used to fix the body, so the anchorage of the element is stabler.

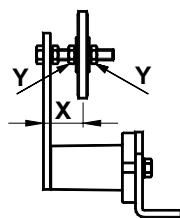

为了给张紧装置预加负荷，只需要放松螺钉 V 并旋转主体上装的扳手，直至达到想要的角度。根据拉紧转矩 Mt 重新锁紧螺钉 V。

To preload the tensioner ,you only have to turn the screw V out and turn the monkey wrench which is put on the body until you reach the wanted angle. You have to lock the screw V again with the couple of tightening screws Mt.

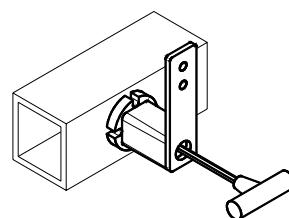

在有必要将配套元件向外端方向安装时，尺度 A 应减低，受力 Q 应比在表格中显示的低 50%。

When you need to mount the KIT on the outside, the dimension A must be reduced the best possible and the force Q must be inferior to the 50% of that one indicated in the table.

在第 页中所描述的配套元件的滑块、滑轮、链轮可使用两个螺帽 Y 轻易安装在尺度 A。

The KITS sliding block, roller, sprocket wheelset, which are described on page 17-18-19-20, can be easily mounted at the dimension X through the two nuts Y.

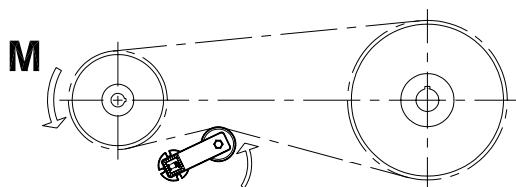

在不可能使用传统式安装方式时，由于钻孔不可见，建议使用 FE 组件。

When the traditional placement (position) is not possible because of the dead connection hole, it would be suggested to use FE elements.

应用实例 / EXAMPLES OF APPLICATION

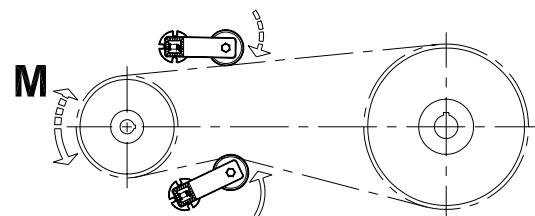

例 1

CRESA 弹性组件应在链条缓慢端并沿滑动方向安置。另外其位置应尽可能接近驱动轮。

CRESA elastic element has to be positioned in the slow portion and in the sliding sense of the chain. Moreover it must be nearer than possible to the working wheel.

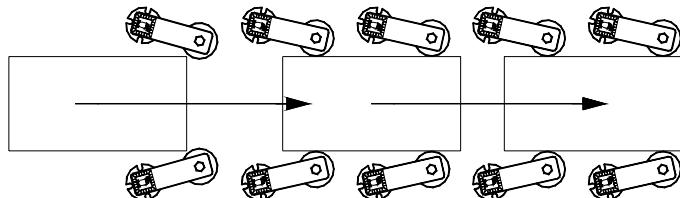

例 2

对于可逆转传动系统，CRESA 组件应安装在两端。由于在张紧臂存在更高的负载，应使用大尺寸的组件以 15°的最大角度加载张紧装置。

For reversible transmission system, CRESA elements must be positioned on both sides. Use greater size elements because in the tight portion occurs a bigger load, but loading the tightener with a maximum angle of 15°.

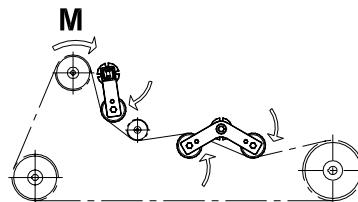

例 3

压力或传送带组件

Pressure or conveyor elements

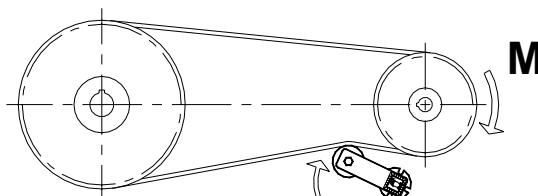

例 4

使用长链条的传动系统，建议使用更多的张紧装置组件。对这个应用类型的理想张紧装置是包括基础组件 CEB-CEBP 和配套元件“V”的装置。

For long transmission system, we recommend the use of more tightener elements. The ideal tightener in this kind of application is the basic element CEB-CEBP with the KIT "V".

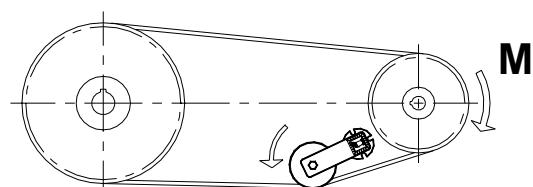

例 5

皮带张紧轮 RP 和 RU 应在接近驱动滑轮的位置安装。也可在传动系统内部安置。

The belt stretcher RP and RU must be set up near the driving pulley. They can be positioned also inside the transmission.

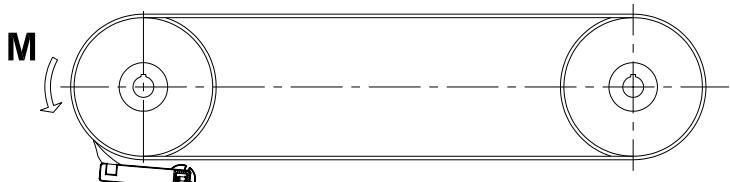

例 6

安装 V 型皮带的滑轮的张紧装置应在传动系统内部安装。

The tightener that set up the pulleys for V-type belt must be assembly inside, in the system of transmission.

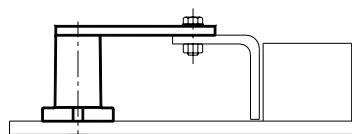

例 7

刮料器用支撑。

Support for scraper.

例 8

导向用支撑。

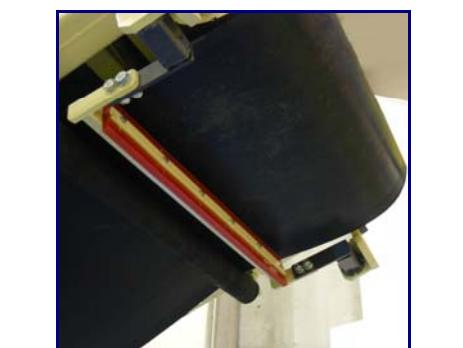

Example as support for guide

一般销售条件 :

- 1) **订货** – 标准材料或特殊材料的订货应始终根据TECNIDEA CIDUE S.r.l. 公司的报价作出。所有的订货对客户都是有约束力的。加工生产一旦开始，便不可接受取消订货或减少订货，除非客户一方赔偿直至中止时刻所使用的材料和加工费用。无论如何，这些费用将由TECNIDEA CIDUE S.r.l.公司决定。
- 2) **价格** – 意指在订货日期有效的价格。所有的价格均为维罗纳交货价计价，包装费除外。如果在供应工程中出现材料费或其他生产费用的增长情况，TECNIDEA CIDUE S.r.l.公司有权根据相应的增长修正价格，这一点也包括已在进行过程中的订货。
- 3) **交货期限** – 唯有TECNIDEA CIDUE S.r.l.公司所指定的交货期限为有效期限。无论如何，此期限只是具有说明意义的。若存在材料供应困难和罢工的情况，或者在任何不可抗力的情况下，交货期限将自动延期，TECNIDEA CIDUE S.r.l.公司没有义务赔偿任何可能的相关损失。材料准备完毕，客户在任何情况下有义务提取所订的材料。
- 4) **运输** – 运输费由订货方负担，即使是到岸计价，风险和危险也由其承担。就可能发生的短装货投诉应在接收货物后8天内提出。如果经商议，运输费由TECNIDEA CIDUE S.r.l.公司负担，或者仅是部分负担，公司保留可选择最经济的运输方式的权利。
- 5) **包装** – 包装费在费用价格中计算。
- 6) **退货** – 如果未经事先批准或有包装费，不接受具任何理由的退货，可能存在的海关手续费及退货完全由买方负担。仓库存放或管理费用保证金的将以退货价值的15%计算并通过欠款通知账单的方式而发放。
- 7) **质量保证** – TECNIDEA CIDUE S.r.l.公司将致力于免费修理或更换由其认定有缺陷的部件。有争议的货物应交还TECNIDEA CIDUE S.r.l.公司所在地，所有费用均免。在将有缺陷的部件修理或拆开复原后，保质期到期。由买方对有缺陷的部件进行的修理仅在TECNIDEA CIDUE S.r.l.公司批准并同意费用预定价的情况下得到承认。
TECNIDEA CIDUE S.r.l.公司对在用户使用其产品，包括有缺陷产品的过程中所造成的损害不负任何责任，也不偿付任何相关的赔款。
- 8) **责任** - TECNIDEA CIDUE S.r.l.公司对在用户使用其产品，包括由缺陷产品的过程中所造成的损害不负任何责任，也不偿付任何相关的赔款。TECNIDEA CIDUE S.r.l.公司按照从属客户提出的特殊细节制造产品，但是对此产品是否由专利保护不负任何责任。
- 9) **付款** – 只有在所商议的方式和期限内所做的付款被认为有效。在付款期过后，TECNIDEA CIDUE S.r.l.公司有权要求付款，并将以超过法定税率以上3%的税率计算罚款利息。在订货方延迟付款或不付款的情况下，TECNIDEA CIDUE S.r.l.公司有权中断在进行过程中的订货的送交或者提出提前付款的要求，无需向订货方保证任何的赔款或赔偿。在生产过程中或材料已由订货方拥有，对材料提出的任何争议不解除订货方在确定期限内付款的义务，应付全部款项并不可要求任何的折扣。
- 10) **财产** – 在就发票额完全支付款项之前，一切寄出的货物仍为TECNIDEA CIDUE S.r.l.公司的财产。
- 11) **主管法院** – 与TECNIDEA CIDUE S.r.l.商业关系相联的任何争议将为维罗纳法院的权限。
